Intelligence Gathering and Sharing Project, will help correctional administrators identify and evaluate Soon, however, a National Institute of Justice (NIJ) initiative, the Corrections/Law Enforcement sources to find patterns and in turn share information and partner with law enforcement to stop, and data analysis/data mining software to sort through massive amounts of information from different prevent, crime.

technology experts from NIJ's Border Research and implementation process easier.

teria to use. The goal of NIJ's Intelligence Gathering feel uncertain about which steps to take next and cri-
tools to their intelligence operations, but they corrections departments want to move toward adding lyze the vast amounts of information contained in large databases by finding patterns and deviations much much more quickly than any team of analysts. Many much information at everyone's fingertips, finding and sharing the right information has become critical.

data analysis tools make it easier to ana-
lyze the vast amounts of information contained in large databases by finding patterns and deviations much more quickly than any team of analysts. Many corrections departments want to move toward adding these tools to their intelligence operations, but they feel uncertain about which steps to take next and criteria to use. The goal of NIJ's Intelligence Gathering and Sharing Project is to make the selection and implementation process easier.

As part of that project, a team of information technology experts from NIJ's Border Research and Technology Center (BRTC), part of the National Law Enforcement and Corrections Technology Center system, and its technical partner, the Space and Naval Warfare Systems Center–San Diego (SSC–SD), go through the same data analysis/data mining tool selection process faced by corrections departments. The project will eventually not only help correctional administrators across the country choose the data analysis tools that meet their needs but also improve their intelligence gathering and sharing capabilities. Once the project is completed, the team will issue a report and offer a workshop on lessons learned.

Other major players in the project are State correctional personnel from Nebraska and Iowa, who say their departments already had information sharing projects but that NIJ's involvement smoothed the process and sped up their time-tables. (Both States have project advisory teams that include local units of the FBI and U.S. Immigration and Customs Enforcement, as well as local law enforcement.)

"The project helped us increase our networking efforts even before the testing began, and that's what we want to see happen," says Laura Schefelt James, Iowa's Assistant Deputy Director for Eastern Operations. "If there is information we can provide that will be of benefit to other agencies, there will also be benefits for us. We see this as a two-way information flow. This particular project applies the [analysis] tool to our database, and it will impact what information we can make available. However, the biggest benefit to us comes from the whole process of learning what our partners need—of learning what information is most pertinent to them."

"NIJ is giving us good feedback and good ideas and keeping us focused," says B.J. Spring, administrative assistant in the Intelligence Division at the Nebraska Department of Correctional Services. "The sharing will happen in a better fashion than if we had just muddled through it ourselves."

BRTC's Dr. Wadad Brooke Dubbleday says the project has shown her that much of what happens within jails and corrections facilities influences what happens on the outside. "Corrections may be able to share information with law enforcement, and it will turn out that each had a piece of the puzzle, and the picture is now complete," she says.

The completed picture includes pieces provided by the mining and analysis software, which finds previously undiscovered relationships and patterns, enabling both corrections and law enforcement to use their resources more effectively and intelligence analysts to perform their jobs at a higher level. In Nebraska, reaching that higher level became a long-term goal several years ago when the State created Spring's position with the specific assignment of compiling statistics potentially related to drug use and looking for patterns. Although Spring and his analysts had recorded some success, he says the
"Those efforts," says Scheffert James. "It was useful to our outside partners and to expand to find out what information would be most useful once the project began."

"In the project, we gathered information and expanded information-gathering efforts once the project began. We saw that we have a great deal of information that can be of value to outside agencies. We view this as an opportunity to find out what information would be most useful to our outside partners and to expand those efforts," says Scheffert James.

Iowa also had already collected similar information and expanded information-gathering efforts once the project began. "We saw that we have a great deal of information that can be of value to outside agencies. We view this as an opportunity to find out what information would be most useful to our outside partners and to expand those efforts," says Scheffert James.

With the thought of expanding those efforts, Iowa decided to access data mining and analysis on the desktop of every member of the project advisory team and all departments of corrections intelligence officers. Iowa also gives access to other investigators who need to analyze data related to a specific case. In Nebraska, the chief information officer at each facility and the investigative team analysts received access. "We wanted to put the tool in the hands of the actual users, the ones who would be taking the information and conducting the investigations," Spring explains. "We wanted it at their fingertips, instead of making them rely on the central office to get information to them."

Although their approaches are similar, the Nebraska and Iowa programs currently run on separate tracks. "We were wondering if we would be able to interact, because we have common borders and are aware that activity certainly crosses State lines," Scheffert James says. She adds that Iowa asked about the possibility and was told it might be arranged in later stages of the program. "Such an interface would be an ideal situation," says Edward Lai, project technical lead from SSC-SD. "Once everything is completely set up and working the way we expect it to, if we can get both States together and get the data flowing between them, that would be an additional accomplishment over and above reaching the project objectives."

If interaction does not happen during the project itself, it will likely occur when the two departments of correction assume control of the data analysis tool. In addition, if other corrections agencies learn from the Nebraska/Iowa experience and set up their own data analysis systems, sharing may eventually take place among more than just those States.

State departments of correction interested in establishing their own data analysis projects will be able to obtain the final report of the project when it becomes available. These agencies also may attend a wrap-up workshop, which will promote data sharing and encourage replication of the project. For more information on the Corrections/Law Enforcement Intelligence Gathering and Sharing Project, contact Dr. Wadad Dubbleday at the Border Research and Technology Center, 888-635-BRTC or unabelda@brtc.nlectr.org.

The selection of evaluation sites and data analysis software for the Corrections/Law Enforcement Intelligence Gathering and Sharing Project resulted from a planned step-by-step process that ultimately will be part of the end product. Project participants knew that numerous data analysis/data mining applications already existed. However, because these applications can be complex and expensive to configure, operate, and maintain, law enforcement agencies and corrections facilities need assistance when it comes to selecting the right one. Therefore, the project team planned to meet three objectives:

- Identify state-of-the-art data analysis/data mining tools to improve intelligence gathering, analysis, and sharing in correctional environments.
- Select an evaluation site and a test tool.
- Prepare a publication describing the selection process and the lessons learned during the project to help others in the field make their own selections.

“We went through it pretty methodically . . . in the hopes that other departments of correction can apply this when selecting tools,” explains Dr. Wadad Dubbleday at the Border Research and Technology Center. The final report, however, will not release the names of the evaluated products, in keeping with the National Institute of Justice (NIJ) policy not to endorse a particular vendor’s technology.

The process started with a survey that was sent to every State department of corrections and a number of the Nation’s larger jails. The project team compared responses to its criteria, which included—

- Preexisting use of an automated data capture system.
- Participation in the Criminal Justice Information System Initiative sponsored by the State Governor’s office.
- Prior staff training in intelligence gathering and analysis.
- Commitment to assign intelligence and information technology staff to participate in the project.
- Agreement to create an onsite project advisory team that includes external law enforcement stakeholders.
- Willingness to train onsite staff in use of the tool and to participate in an after-action review and evaluation process.

The team narrowed the field by conducting telephone interviews and site visits before selecting Iowa and Nebraska.

The selection process for the data mining and analysis tool followed a similar pattern. Again, the team first developed selection criteria, including—

- Product features.
- Cost.
- Learning curve.
- Data requirements.
- System requirements.
- Vendor support.

Particular emphasis was placed on finding tools that included GIS (geographic information system) mapping capability, the ability to search free text for keywords, and a “transparent” structure that allows users to get similar query results no matter how the databases themselves are constructed. The team started with a broad-based process, in this case answering yes/no questions by visiting vendor websites. They then narrowed the field by compiling responses in a spreadsheet and finally inviting a few vendors to make presentations.

On selection, NIJ paid for licenses for each of the two tools for a year; after that, continued maintenance is the responsibility of the Iowa and Nebraska DOCs. Each State’s intelligence analysts received training and each DOC improved its infrastructure as needed. Evaluations began in late summer 2004.

The final report, to be published in 2005, will outline the selection process, explain the ease or difficulty involved in learning to use the software, and list potential savings and lessons learned. On publication, the project team plans to hold a workshop for other DOCs that are interested in purchasing data analysis tools.
range-finder binoculars to the advisory council of the National Institute of Justice’s Border Research and Technology Center (BRTC), questions began racing through the mind of John Bott, a BRTC staff engineer. Asbell explained that National Guard personnel onboard helicopters used the binoculars to provide global positioning system (GPS) coordinates of marijuana fields growing in remote areas of Kentucky, enabling eradication teams to return to wipe out the crop. The National Guard, he said, was using military PLGR (precision lightweight GPS receiver) technology to provide the coordinates. This technology replaced the Guard’s former system—a spotter marking an X on a paper map.

“Right then, I thought there could be other applications,” Bott recalls. “I thought, if I ever had a chance to get my hands on a pair, I’d like to take them to a law enforcement agency and let them figure out how they might use them.” When Bott finally got his chance, he learned that a pair of binoculars was already in the hands of a researcher at the Space and Naval Warfare Systems Center–San Diego (SSC–SD), the U.S. Navy’s research, development, test and evaluation, engineering, and fleet support center for command, control, and communication systems and ocean surveillance. The Center also provides technical support to BRTC. Bott contacted the researcher and learned that SSC–SD had already adapted the laser range-finder binoculars for use by Navy Special Forces, adding laptop capability and replacing PLGR with a more readily available commercial GPS system.

“We were able to capitalize on the Navy’s investment, and that allowed us to move forward with the law enforcement project,” Bott says. The next step involved finding a law enforcement agency to test the device. He realized that tracking people or objects with GPS technology had little appeal in a major city like San Diego, where everything revolves around street addresses. However, the U.S. Border Patrol in San Diego does operate in remote areas. It became the first agency to express an interest in evaluating the system, which became known as BorderTrack.

Primarily developed by Scot McIntosh, a contractor supporting Bott and BRTC, BorderTrack incorporates a laptop computer and/or personal digital assistant (PDA) with the laser range-finder binoculars, enabling the user to sight on a target, obtain its GPS position, and generate a report. However, development did not end there; the system currently has three software options.

- **BorderTrack.** Combines GPS and laser range-finder output to pinpoint the location of a target; it also generates a popup reporting form that can be exported to a database.
- **LaserFind.** A simpler application of BorderTrack that yields just the target’s location, which the user can either enter as a waypoint into a handheld GPS, plot on a paper map, or enter into separate mapping software.
- **TeleMapper.** Adds mapping capability, locating the observer, the target, and a sideline between them on a map, enabling users to pick out commonly used roads and well-known geographic features.

TeleMapper comes in a laptop version only, whereas BorderTrack and LaserFind also have PDA versions. All software options, however, can display locations in various formats. In addition, a mount allows the user to use the binoculars with a thermal heat scope to generate even more precise readings, and a remote control capability enables the user to take cover or shelter after setting up the BorderTrack system at a good vantage point.

The Border Patrol has tested the device from a helicopter and generated results that were accurate within 100 meters, despite movement and vibration. Although the right connections allowed the right pieces to come together to create BorderTrack, one key piece is missing: readily placing it in the hands of local law enforcement agencies, particularly in rural areas. “The binoculars are fairly expensive, so a lot of law enforcement agencies would not be able to buy them,” Bott says. “I’ve talked to sheriffs’ offices that were interested until they found out the price. We’ve also done market surveys to attempt to locate other, less expensive equipment that serves the same purpose but has located nothing that is comparable.”

BRTC is exploring a way to put the last piece in place: adding the device to the Office of National Drug Control Policy (ONDCP)–Counterdrug Technology Assessment Center Technology Transfer program. Law enforcement agencies submit proposals to the program, and if approved, they receive equipment and training at no charge. Because BorderTrack can be used to trace drug trafficking activities, Bott believes it could be included in ONDCP’s catalog of approved technologies, which would in turn grant access to the device to local law enforcement agencies. If that happens, the potential suggested by Major Asbell’s presentation could be fulfilled.

For more information on the BorderTrack system, contact John Bott at 619–553–1283 or botjp@spawar.navy.mil.

**The Border Patrol has tested the device from a helicopter and generated results that were accurate within 100 meters, despite movement and vibration.**
TechBeat is the award-winning newsmagazine of the National Law Enforcement and Corrections Technology Center (NLECTC) system. Our goal is to keep you up to date with current and developing technologies for the public safety community, as well as other research and development efforts within the Federal Government and private industry. TechBeat is published four times a year.

Individual Subscriptions: TechBeat is available at no cost. If you are not currently on our mailing list, please call us at 800–248–2742, fax 301–519–5149, or e-mail us at asknlectc@nlectc.org.

Domestic Department Subscriptions: If your division, department, or agency has more than 20 individuals, we can drop ship as many copies as you require. All you have to do is provide us with the quantity needed, a shipping address (no Post Office boxes, please), and a contact name and telephone number. Your only obligation is to disseminate them once they arrive. If you require fewer than 20 copies, please provide us with the names and addresses of individuals who are to receive the newsmagazine and we will send copies directly to them. Contact Rick Neimiller, TechBeat managing editor, at 800–248–2742, for additional information or to subscribe.

Address Correction: Please notify us of any change in address or point of contact. Call 800–248–2742; fax 301–519–5149; or e-mail asknlectc@nlectc.org.

Article Reproduction: Unless otherwise indicated, all articles appearing in TechBeat may be reproduced. We do, however, request that you include a statement of attribution, such as: “This article was reproduced from the Fall 2004 issue of TechBeat, published by the National Law Enforcement and Corrections Technology Center, a program of the National Institute of Justice, 800–248–2742.”

Awards: TechBeat has received numerous awards, including the 1998 Best of Category, Excellence in Printing Award from the Printing & Graphic Communications Association; the first-place 1998 Blue Pencil Award for Most Improved Periodical from the National Association of Government Communicators; the 1999 Silver Inkwell Award of Merit from the International Association of Business Communicators; and the APEX 2001 Award of Excellence for Magazines and Newspapers–Printed.

Wayne Barte, a senior project manager at OLETC, approached Phillips Environmental Products Inc. in November 2003 during the Montana Small Business Innovation Research Conference in Bozeman when he heard company representatives making a pitch for the portable toilet system to another conference attendee. “I went over, introduced myself, and said I could think of a couple of applications for the corrections field,” Barte recalls. “I asked if they had ever given any thought to that market, and their answer was none.”

Barte says he initially thought of the ever-present need to examine waste products for contraband. Inmates sometimes swallow balloons or other objects filled with substances such as cocaine, and a correctional officer has to search body waste for the item. Correctional staff often put an inmate suspected of smuggling alone in a cell and turn off the water to the toilet so that the waste can be trapped.

According to Barte, instead of water or chemicals, the PETT system uses a vegetable-based powder enclosed in plastic bags for individual use. The powder gets the waste products into a semisolid, whitish material. Barte thought officers could look at the bag’s contents, feel the outside of the used bag to locate any contraband, and then extract it. The company found his ideas of interest and agreed to a demonstration of the product at the January 2004 meeting of OLETC’s Advisory Council. In addition, Barte contacted the Northeastern Technology Product Assessment Committee (NTPAC), a regional forum that shares information about corrections technologies, to schedule a demonstration.

At the demonstrations, members of both groups saw how the portable toilet system works. PETT is about the same size as a standard U.S. toilet, but it breaks down to approximately the size of a large briefcase. Each individual uses his or her own powder-filled removable plastic bag, which zips shut for transport away from remote sites. Because the double-layered, puncture-resistant bags are biodegradable, they can be placed in any garbage can. A privacy tent, which includes stakes and its own backpack carrying case, has a 4-foot-by-4-foot base. It weighs 6 pounds and fits into a tote, which also holds the toilet bags, and other accessories and includes a special outside compartment dedicated to transporting used bags.

The deputy director of probation and parole for the State of New Mexico pointed out that the accompanying tent made the portable toilet perfect for road crews. Currently, he said, if someone needs to use the restroom, the whole crew has to stop working so that officers can load everyone up and take them to a restroom. “With the tent, they can pack it out and keep on working.”

At both demonstrations, participants came up with more potential uses for the toilet. Diane Quinn, OLET C technology agent for corrections and the center’s representative to NTPAC, says representatives brainstormed one use after another, including the following scenarios.

◆ In the event of a natural disaster, such as a flood, correctional facilities typically are not evacuated; rather, staff and inmates shelter in place. If the facility loses its running water, staff could set up the portable toilets.
◆ SWAT teams on training exercises typically spend extended periods in the wilderness. The lack of facilities can pose a problem, particularly for female personnel.
◆ Correctional officers transporting a prisoner often feel reluctant to stop at rest areas or at businesses because of the potential for escape attempts. The portable toilet system could be set up in the back of the transport vehicle.
◆ Law enforcement officers using a van on a stakeout could use a portable toilet.

Although OLETC and NTPAC members thought of many uses, no one thought of any needed modifications. Barte and Quinn agree this is highly unusual, because members of both groups often ask vendors to make substantial modifications. (One small change that had been suggested in November 2003—having clear bags in addition to the original green—had already been implemented by the January 2004 demonstrations.) The only real concern that arose from the demonstrations was the effect of the gelling powder on latex items such as gloves. Quinn notes that the company completed a series of tests that confirmed the powder has no adverse effects.

The Office of Law Enforcement Technology Commercialization has deployed demonstration units of the Portable Environmental Toilet for evaluation to the Montana Small Business Innovation Research Conference. For more information, contact Diane Quinn or Wayne Barte, 888-396-5382, or dquinn@oletc.org or wbarte@oletc.org.
Like many instructors, Dan Helms hears from former students. They tell him how they’ve used geographic information system (GIS) techniques, including Animal Movement, which they learned during Crime Mapping and Analysis (CMAP) classes. They let him know how they have used geographic information. We’d have an attack in the morning, with two mortar rounds fired at us from a single location, Ortiz maintains that despite the obvious differences in environment and strategy, much of his experience in Iraq is directly transferable to domestic law enforcement. He believes that the same principles behind CMAP training have universal applicability to the problems facing public safety personnel worldwide. “The techniques we use in Iraq—attacks with IEDs [improvised explosive devices], rocket-propelled grenades, and small arms—are all to a certain degree, analogous to gang attacks,” he says. “Though the motivations of the groups involved might differ, their techniques are the same, and after all, they’re human. They all get to sleep somewhere and use the roads to get around. There are definite geographic reasons why a crime takes place where and when it does.”

Whether in Iraq or the United States, the one-present problem of criminal activity exists. With the advent of GIS technologies and training, law enforcement personnel have been given a crucial tool to analyze, understand, and potentially defeat serial crime.

**RACKING THE PREDATOR**

Like many instructors, Dan Helms hears from former students. They tell him how they’ve used geographic information system (GIS) techniques, including Animal Movement, which they learned during Crime Mapping and Analysis (CMAP) classes. They let him know how they have used geographic information. We’d have an attack in the morning, with two mortar rounds fired at us from a single location, Ortiz maintains that despite the obvious differences in environment and strategy, much of his experience in Iraq is directly transferable to domestic law enforcement. He believes that the same principles behind CMAP training have universal applicability to the problems facing public safety personnel worldwide. “The techniques we use in Iraq—attacks with IEDs [improvised explosive devices], rocket-propelled grenades, and small arms—are all to a certain degree, analogous to gang attacks,” he says. “Though the motivations of the groups involved might differ, their techniques are the same, and after all, they’re human. They all get to sleep somewhere and use the roads to get around. There are definite geographic reasons why a crime takes place where and when it does.”

Whether in Iraq or the United States, the one-present problem of criminal activity exists. With the advent of GIS technologies and training, law enforcement personnel have been given a crucial tool to analyze, understand, and potentially defeat serial crime.
The National Law Enforcement and Corrections Technology Center (NLECTC) system, a program of the National Institute of Justice (NIJ), offers no-cost assistance in helping agencies large and small implement current and emerging technologies.

The NLECTC system was established in 1994 by NIJ’s Office of Science and Technology to deliver information and technology assistance to more than 18,000 police departments; 50 State correctional systems; thousands of prisons, jails, and parole and probation departments; and other public safety organizations.

Contact NLECTC for:

Technology Identification
The NLECTC system provides information and assistance to help agencies determine the most appropriate and cost-effective technology to solve an administrative or operational problem. We deliver information relating to technology availability, performance, durability, reliability, safety, ease of use, customization capabilities, and interoperability.

Technology Assistance
Our staff serve as proxy scientists and engineers. Areas of assistance include unique evidence analysis (e.g., audio, video, computer, trace, and explosives), systems engineering, and communications and information systems support (e.g., interoperability, propagation studies, and vulnerability assessments).

Technology Implementation
We develop technology guides, best practices, and other information resources that are frequently leveraged from hands-on assistance projects and made available to other agencies.

Property Acquisition
We help departments take advantage of surplus property programs that make Federal excess and surplus property available to law enforcement and corrections personnel at little or no cost.

Equipment Testing
In cooperation with the Office of Law Enforcement Standards (OLES), we oversee the development of standards and a standards-based testing program in which equipment such as ballistic- and stab-resistant body armor, double-locking metallic handcuffs, and semiautomatic pistols is tested on a armor, double-locking metallic handcuffs, such as ballistic- and stab-resistant body based testing program in which equipment development of standards and a standards- In cooperation with the Office of Law Enforcement, we help departments take advantage of surplus resources, NLECTC staff have access to the latest innovations in research and development.

We introduce and demonstrate new and emerging technologies through such special events, conferences, and practical demonstrations as the Mock Prison Riot (technologies for corrections) and an annual public safety technology conference. On a limited basis, NLECTC facilitates deployment of new technologies to agencies for operational testing and evaluation.

We provide hands-on demonstrations of the latest technologies to address such operational issues as crime and intelligence analysis, geographic information systems, explosives detection and disablement, capacity building, and assistance to help agencies determine the most appropriate and cost-effective technology.

Technology Needs Assessment
Our national body of criminal justice professionals—the Law Enforcement and Corrections Technology Advisory Council (LECTAC)—ensures that we are focusing on the real-world needs of public safety agencies.

Because most of the country’s law enforcement and corrections services are provided at the local level, the NLECTC system is composed of five regional centers and is complemented by several specialty offices and a national center. Most centers and offices are collocated with or supported by federally funded technology partners so they can leverage unique science and engineering expertise.

With a network of regional centers and specialty offices located across the country, the NLECTC system has been able to deliver expertise in a number of technologies by forming partnerships with such host organizations as the Air Force Research Laboratory, the Space and Naval Warfare Systems Center, and The Aerospace Corporation. Through these partnerships, NLECTC staff have access to the latest innovations in research and development.

The NLECTC system serves as an ‘honest broker’ resource for technology information, assistance, and expertise.
TECHshorts is a sampling of the technology projects, programs, and initiatives being conducted by the National Institute of Justice and the centers and specialty offices that constitute its National Law Enforcement and Corrections Technology Center (NLECTC) system. If you would like additional information concerning any of the following TECHshorts, please refer to the specific point-of-contact information that is included at the end of each entry.

In addition to TECHshorts, an online, weekly technology news summary containing articles relating to technology developments in public safety that have appeared in newspapers, newsmagazines, and trade and professional journals is available through the NLECTC system’s website, JUSTNET, at www.justnet.org. This service, the Law Enforcement and Corrections Technology News Summary, also is available through an electronic e-mail list, JUSTNETNews. Each week, subscribers to JUSTNETNews receive the news summary directly via e-mail. To subscribe to JUSTNETNews, e-mail your request to asknlectc@nlectc.org or call 800–248–2742.

Note: The mentioning of specific manufacturers or products in TECHshorts does not constitute the endorsement of the U.S. Department of Justice, National Institute of Justice, or the NLECTC system.

On the Trail of Sex Offenders, Kidnappers

NLECTC–West

In 2003, the Washington State legislature passed Senate Bill 5404, which directed the State’s Department of Corrections (DOC), Department of Social and Health Services, and Washington Association of Sheriffs and Police Chiefs (WASPC) to conduct a pilot project to track level-three sex offenders and kidnappers using passive data logging global positioning systems (GPS).

The purpose of the field trials was to test the availability, reliability, and effectiveness of these electronic monitoring systems. WASPC and the DOC requested technology assistance from NLECTC–West with the project. The results of the field trials, in which one commercial product was evaluated, have been documented and are available in a final report published by the DOC. Key findings include: Batteries are important and may be impacted by the amount of time the offender is allowed to be in the community; false alarms about the bracelet being lost may depend on the type of bracelet; GPS signal acquisition may be difficult when leaving a building in an “urban canyon” or when riding on a bus; poor phone lines in an offender’s living quarters (e.g., old hotels) may impact reporting to the monitoring station; and clothing may impact GPS reception. For more information and access to the report, contact Mike Epstein at NLECTC–West, 888–548–1618, epstein@law-west.org.

An Intelligence Center for the 21st Century

NLECTC–Northeast

A piece of information collected by a police officer might seem insignificant, but when combined with other pieces and further analyzed it may yield intelligence that could deter a crime or uncover a terrorist plot. The partnership of the law enforcement and intelligence communities is key to confronting today’s complex criminal landscape. Prior to September 11, 2001, intelligence collection efforts were often informal and lacked structure. Today, however, a proactive approach to policing is needed and intelligence collection must include all Federal, State, county, and local agencies. The Upstate New York Regional Intelligence Center (UNYRIC), a multijurisdictional, colocated intelligence center, collects, analyzes, and disseminates intelligence. It also makes relevant Federal counterterrorism information available in real-time to police officers and offers a model to guide information-sharing initiatives in other States. NLECTC–Northeast is partnering with the New York State Police to support a systematic method for defining how technology is applied and integrated (technology insertion) at the center. The technology insertion model involves planning and direction (determining what you need to know), collection (gathering what you do not know), analysis and production (transforming information into intelligence), and dissemination (releasing and delivering intelligence). For more information about UNYRIC and the support provided by NLECTC–Northeast, call 888–338–0584, ask for Maureen Regan, maureen.regan@dolphtech.com, or Deborah Cutler, debbra@dolphtech.com.

Body Armor Safety Initiative

NLECTC–National

In response to concerns from the law enforcement community, the U.S. Department of Justice began an initiative that addresses the reliability of body armor used by law enforcement personnel and examines the future of bullet-resistant technology and testing. In conjunction with NLECTC–National and the Office of Law Enforcement Standards, the National Institute of Justice is examining Zylon®-based bullet-resistant vests (both new and used) and reviewing the existing process by which bullet-resistant vests are certified. The results of the studies are being communicated as rapidly as possible to law enforcement and the public via a recently established webpage (www.ojp.usdoj.gov/nij/sciencetech/body_armor.htm). The webpage includes information about NENS, research, official statements, and other resources on the topic of body armor safety. Law enforcement and corrections agencies seeking more information about the Body Armor Safety Initiative should contact NLECTC–National, 800–248–2742 or asknlectc@ nlectc.org. Media inquiries should be directed to the Office of Communication, 202–307–0703 or askoirp@ojp.usdoj.gov.

‘Fingering’ Inmates

NLECTC–Southeast

Physically accounting for institutionalized inmates is critical. Currently in the United States, a manual count with physical identification of each inmate is done on average of five times a day. These counts are labor intensive and risky in terms of margin for error. They also present opportunities for inmates to frustrate and disrupt security efforts. Biometric identification using finger-imaging technology may be a viable alternative. NLECTC–Southeast, in partnership with Oak Ridge National Laboratory, is developing a portable biometric identification scanner as a tool to under–take inmate counts. The Southeast Center envisions that with a biometric counting system correctional officers will use handheld units to scan inmates’ fingerprints and send them back to a central database, which will confirm the fingerprint as a match and, in less than 5 seconds, send back the inmate’s mug shot for visual verification. As correctional officers complete their scanning rounds, the central unit or database will generate a report that indicates either all inmates have been accounted for or lists those who are missing. Although the biometric counting system may have little impact on the time it takes to perform an initial count, it will completely eliminate the need for second counts and rollcall counts. It also will immediately provide data on missing inmates. For more information about finger-imaging technology and its use in corrections, contact Bob Donlin, 800–292–4385 or donlin@nlectc-se.org.

Helping Hand for Handwriting Analysis

National Institute of Justice

Through funding from the National Institute of Justice, State University of New York (SUNY) researchers are developing a software system, called CEDAR-FOX, to perform tasks used by forensic document examiners (FDEs) in the examination of handwriting evidence (such as ransom notes, forged checks, etc.). CEDAR-FOX, which runs on Windows® platforms, automatically extracts and analyzes handwriting. For more information, contact Maureen Regan at the Web page www.cedar-fox.com.
"Phishing" (pronounced: fishing) may lend itself to corny headlines, but it describes a serious, sophisticated practice in which Internet con artists—using bogus e-mails and websites designed to look like those of legitimate companies, banks, or government agencies—trick unwitting customers into divulging sensitive financial and personal information.

Staff at the CyberScience Laboratory (CSL) in Rome, New York, have been gathering information on this phishing epidemic for many months to share with law enforcement agencies throughout the United States. Funded by the National Institute of Justice to be a national resource center in the fight against cybercrime, CSL has begun to get requests for training, assistance, and outreach on this proliferating online crime.

In a typical phishing scam, the perpetrator copies the webpage code from a well-known site (such as eBay®, Citibank, or AOL®) and uses it to set up a replica page, complete with company logo, fonts, styles, and links to mimic the real company webpages. He or she then uses spamming techniques to send a million or more e-mails with a single click. The e-mails advise Internet users that their billing information needs to be confirmed or updated because of a technical or security problem and directs them to click on a hyperlink to reach the official corporate or institutional website.

In actuality, the link sends them to the scammer’s look-alike page. Once there, the user is asked to provide credit card information, password, personal identification number, Social Security number, mother’s maiden name, and other closely guarded data. Armed with this information, the scanner can proceed to run up charges in the user’s name, empty bank accounts, apply for loans or new credit cards, and commit many other types of identity theft.

According to the Anti-Phishing Working Group (APWG), an industry watchdog organization, consumer phishing attacks are on the rise. In April 2004, 1,125 unique new attacks were reported—an increase of 180 percent over the previous month. (The number of attacks may even be higher, because APWG can only report the number of scams they hear about.) The group estimates that about 5 percent of phishing e-mail recipients “take the bait,” but if 1 million e-mails are sent out, 50,000 people will be victims.

Gartner, Inc. (http://www4.gartner.com/itil), an information technology research firm, estimates that—

- More than 57 million Internet users in the United States have received some sort of e-mail related to a phishing scam.
- Close to 2 million checking accounts have been exploited.
- Annual losses associated with phishing exceed $32 billion.

In July 2004, CSL’s Jeffrey Isherwood discussed phishing scams at a meeting of the U.S. Secret Service’s Electronic Crimes Task Force during a cybercrime seminar in Charlotte, North Carolina. Isherwood covered such topics as how to spot phishing e-mails, tools for analyzing e-mail headers and tracking phishing e-mail to its source, and the need for law enforcement agencies to educate the public about phishing.

“Public awareness is the key, as it is in [fighting] all types of crime,” says Isherwood. “People need to be suspicious of any e-mail that solicits credit card or other confidential information; that is not how legitimate companies work.” And he cautions that those receiving a phishing e-mail should not click on the hyperlink and should not send a hard copy to report the incident; rather, they should forward the e-mail as an attachment to an appropriate resource (see “If You Get Hooked . . .”). To trace a bogus e-mail, investigators need to “look under the hood” at the code beneath the headers to figure out its source—not a simple task. Phishing e-mails are often relayed through dozens of servers in an attempt to hide the sender’s true location.

Law enforcement agencies interested in learning about the methods of phishing scammers and the resources available to thwart them can contact the CyberScience Laboratory at 888–338–0584 or register at www.cybersciencelab.com

If you receive a possible phishing e-mail, do not respond to it. Send copies of the e-mail to the Federal Trade Commission (FTC) at uce@ftc.gov and to the Anti-Phishing Working Group at reportphishing@antiphishing.org. Also send a copy of the e-mail to the “abuse” e-mail address at the company that is being spoofed (e.g., spoofed@ebay.com).

If you have already disclosed your personal information to a possible phishing e-mail or website, immediately file an online complaint with the Internet Crime Complaint Center (a joint project of the FBI and the National White Collar Crime Center) at http://www.ic3.gov. Also go to the FTC’s identity theft website at http://www.consumer.gov/idtheft and follow the directions there for reporting information to credit bureaus, credit card companies, and law enforcement.

In addition, an article titled “Protect Yourself Online” in the September 2004 edition (Vol. 69, No. 9) of Consumer Reports offers information and resources regarding phishing scams, computer viruses, junk e-mail (spam), and spyware.
The National Law Enforcement and Corrections Technology Center is supported by Cooperative Agreement #96-MU-MU-K011 awarded by the U.S. Department of Justice, National Institute of Justice. Analyses of test results do not represent product approval or endorsement by the National Institute of Justice, U.S. Department of Justice; the National Institute of Standards and Technology, U.S. Department of Commerce; or Aspen Systems Corporation. Points of view or opinions contained within this document are those of the authors and do not necessarily represent the official position or policies of the U.S. Department of Justice.

The National Institute of Justice is a component of the Office of Justice Programs, which also includes the Bureau of Justice Assistance, Bureau of Justice Statistics, Office of Juvenile Justice and Delinquency Prevention, and Office for Victims of Crime.

In addition to funding the National Law Enforcement and Corrections Technology Center, the National Institute of Justice (NIJ) and other Federal agencies support the National Criminal Justice Reference Service (NCJRS), assisting a global community of policymakers, practitioners, researchers, and the general public with justice-related research, policies, and programs.

NCJRS offers reference and referral services, publications, onsite and offsite conference support, and other technical assistance. The easiest way to access NCJRS is online.

Start at http://www.ncjrs.org. The NCJRS website showcases the latest criminal and juvenile justice and drug policy information. Take advantage of—

- Topic-specific resources.
- Online registration and ordering.
- Searchable abstracts and calendar of events databases.

Stay informed. Register at http://puborder.ncjrs.org to receive—

- NCJRS Catalog. A bimonthly periodical that highlights recent publications and products and contains a convenient online order form.
- JUSTINFO. A biweekly electronic newsletter that includes links to full-text versions of printed publications.
- E-mail notifications. Periodic messages about new publications and resources that match your specific interests.

Ask questions. Share comments. Get answers to your questions or share suggestions about NCJRS services at—

- http://askncjrs.ncjrs.org (questions)
- http://tellncjrs.ncjrs.org (comments)

NCJRS Contact Information at a Glance

Web: http://www.ncjrs.org
Phone: 800–851–3420 (Monday – Friday, 10 a.m. to 6 p.m. e.s.t.)
Fax: 301–519–5212
Mail: NCJRS, P.O. Box 6000, Rockville, MD 20849–6000

The following publications are available through the National Law Enforcement and Corrections Technology Center–National:

**Michigan State Police Tests 2005 Patrol Vehicles.** This bulletin summarizes the test results from the Michigan State Police 2005 model year patrol vehicle evaluations.

**2005 Model Year Vehicle Evaluation.** This equipment performance report contains the complete results of comprehensive tests conducted by the Michigan State Police on 2005 model year police patrol vehicles. Vehicles were subjected to major tests and evaluations, including vehicle dynamics testing, acceleration and top-speed testing, brake testing, ergonomics and communications evaluations, and fuel economy evaluations.

**NLECTC Tests Walk-Through Metal Detectors for Public Safety Applications.** This bulletin summarizes the results of testing performed on five models of walk-through metal detectors. The models were tested for compliance with the National Institute of Justice’s walk-through metal detector standard. (This document is law enforcement sensitive. Requests for copies must be made on agency letterhead.)

**Equipment Performance Report: Walk-Through Metal Detectors.** This equipment performance report presents detailed results of testing performed on five models of walk-through metal detectors. The models were tested for compliance with the National Institute of Justice’s walk-through metal detector standard. (This document is law enforcement sensitive. Requests for copies must be made on agency letterhead.)

To obtain the above publications, write NLECTC, 2277 Research Boulevard, Mail Stop 8J, Rockville, MD 20850; telephone 800–248–2742; or e-mail asknlectc@nlectc.org.

Publications also can be downloaded from JUSTNET at www.justnet.org unless otherwise noted.
Crossing the Boundary With Data Analysis

A white paper detailing the Kansas City Regional Crime Analysis Geographic Information System (KCRCA GIS) project is available from NLECTC–Rocky Mountain. The KCRCA GIS project is a cooperative effort between the Rocky Mountain Center and a group of nine police departments from the Kansas City, Kansas, and Kansas City, Missouri area. The goal of KCRCA GIS is to develop a system to help different departments within a given geographic region to securely share crime analysis data in numerous different formats via the Internet. According to NLECTC–Rocky Mountain, results have been impressive thus far. System participants now have access to each other’s data and can perform analyses on any events that occur, regardless of jurisdictional boundaries. Query capabilities include location, date, time, modus operandi, and suspect and vehicle information. For a copy of the white paper or more information, contact Danielle DiGioiso, 800–416–8088, cmap@du.edu.

Calling Inspector Raman

Office of Law Enforcement Technology Commercialization

The Office of Law Enforcement Technology Commercialization (OLETC) is assisting Wyoming-based company DeltaNu in the commercialization of a real-time, handheld crime scene investigation laboratory called Inspector Raman™. The device uses Raman spectroscopy, a method of chemical analysis that enables real-time reaction monitoring and characterization of compounds in a noncontact manner. A sample is illuminated with a laser and the scattered light collected. The wavelengths and intensities of the scattered light can be used to accurately identify most chemical materials. Raman spectroscopy technology is already widely used in the chemical, polymer, semiconductor, and pharmaceutical industries because of its high information content and ability to avoid sample contamination. Currently, the device is under field evaluation by a major metropolitan law enforcement agency. It also was one of eight demonstration technologies presented at the September 2004 meeting of OLET C’s Advisory Council. In addition, representatives of DeltaNu attended OLET C’s Commercialization Planning Workshop®. For more information about Inspector Raman or commercialization assistance provided by OLET C, contact Wayne Bar te, 888–306–5382 or wbar te@ole tc.org.
